A;Description: Cloning of a cDNA encoding ovine keratinocyte growth factor.
A;Reference number: S49501
A;Stecus: preliminary
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-194
A;Cross-references: EMBL:Z46236; NID:g559503; PIDN:CAA86306.1; PID:g559504
C;Superfamily: fibroblast growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A;Molecule type: mRNA

acidic fibroblast growth factor - chicken
NyAlternate names: endothelial cell growth factor
Cispecies: Gallus gallus (chicken)
Cispecies: Gallus gallus (chicken)
Cispecies: Gallus gallus (chicken)
Cispecies: Gallus S02639
Rischmuerch, H.; Risau, W.
Development 111, 1143-1154, 1991
A;title: Differentiating and mature neurons express the acidic fibroblast growth factor cispecies number: A60130; MUID:91347925; PMID:1715259
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A Molecule type: mRNA

Sequence 21588, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

FILLE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

NUMBER OF SEQ ID NOS: 33142
      TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS FILE REFERENCE: 107196,136

FILE REFERENCE: 107196,136

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 18109

LENGTH: 187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GENERAL INFORMATION:

Sequence 2618, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196,136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT PILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 2618

LENGTH: 969

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: MACT G. RUBenfield et al.
APPLICANT: MACT G. RUBenfield et al.
APPLICANT: MACT G. RUBENFIELD:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT PAPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-07-27
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

LENGTH: 247

New nucleic acid molecule useful for treating disease, e.g. infertility, impotence, or testicular cancer.

Claim 17; Page 39; 61pp; English.

The present sequence represents an epitope-bearing portion of human fibroblast growth factor-21 (FGF-21). FGF proteins regulate growth and differentiation of a variety of cell types. FGF-21 mucleic acids and polypeptides are useful for treating diseases and disorders characterised by inadequate numbers of hepatic cells, preferably cirrhosis of the liver. They may also be used in the treatment of infertility, impotence, and testicular cancer, as well as leukemia, lymphoma, autoimmune disease, or proliferative disorders of the thymus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an active variant (1) of a fibroblast corresponding at least one mutation in the beta-8-beta-9 loop, having enhanced specificity for one receptor subtype compared to the corresponding wild type FGF, by decreasing the biological activity mediated by at least one receptor subtype while retaining the activity mediated through another receptor subtype will has gytostatic, vulnerary, osteopathic and antiarthritic activities. (1) has gytostatic, vulnerary, of vasculogenesis or angiogenesis. (1) is useful for preparing a medicament and for treating a disease or disorder related to normal or abnormal FGF receptors (FGFRs), especially skeletal disorders, cancer, to chooper the compared of the compared of processes. (1) is useful in detection and treatment of various FGFR processes. (1) is useful in detection and treatment of various FGFR compared disorders including skeletal disorders e.g. achondroplasia, and osteoporosis, and cartiage defects, multiple companies and expression systems suitable for pharmaceutical production, targeting of chades or other agents to tissues and cells having specific FGFR subtypes, and serve as template for the formation of improved agonists and cancer. The present sequence represents a FGF core structure amino acid cancer. The present sequence represents a FGF core structure amino acid cores.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes the protein and coding sequences of thuman fibroblast growth factor (FGF) 19 homologue FGF19X, the former which is shown here. The sequences can be used in the prognosis and treatment of proliferative diseases such as cancer, restenosis, psoriasis, rheumatoid arthritis and Dupuytren's contracture, as well to stimulate cell growth for treating neurological disorders such as Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Novel isolated fibroblast growth factor-like polypeptide useful for treating, preventing or ameliorating cirrhosis, inflammatory bowel disease, mucositis, Crohn's disease, diabetes, obesity, stroke and

Claim 14; Page 116-117; 138pp; English

The sequence represents a fragment of a fibroblast growth factor-like (FGF-like) polypeptide. FGF-like protein and its associated nucleic acid play a role in modulating body growth, maturation or life-span. They are also useful for treating, preventing or ameliotating disorders such as cirrhosis, inflammatory bowel disease, mucositis, Crohn's disease, diseases, damage to renal tubules as a result of acute tubular necrosis, haematopoietic cell reconstitution following chemotherapy, wasting syndromes (e.g., cancer associated cachexia), damage to the corneal of epithelium, lens or retinal tissue, multiple sclerosis, myopathies, short stature, delayed maturation, alopecia, abnormalities of androgen target organs, connection, alopecia, abnormalities of androgen target organs, bronchopulmonary dysplasia, acute respiratory distress syndrome, tumours of the eye or other tissues, atherosolerosis, hypercholesterolemia, stroke, osteoporosis, osteoarthritis, muscle atrophy, sarcopenia, baldness, wrinkles, increased taigue, decreased stamina, decreased baldness, wrinkles, increased fatigue, decreased stamina, decreased cardiac function, immune system dysfunction, cancer, Parkinson's disease, senile dementia, Alzheimer's disease, and decreased cognitive function

Novel rFGF11 polypeptide and polynuclectide, a member of fibroblast growth factor family, for stimulating proliferation of mesenchymal, osteoblastic lineage cells and treating diabetes, obesity, osteoporosis,

Claim 1; Page 63; 69pp; English.

The present sequence is human fibroblast growth factor (FGF) homologue, CC zFGF11 protein. zFGF11 gene is located on chromosome 19. zFGF11 is useful for stimulating proliferation of mesenchymal cells, osteoblastic lineage cells. zFGF11 is useful for identifying chromosomal disorders associated with abnormal expression of zFGF11 protein. zFGF11 is also useful for stimulation, inhibition or proliferation of myocytes, smooth muscle cells adipocytes, chondrocytes, neural tube-derived stem cells neural cells and neuronal progenitors, pancreatic cells, prostate-crest stem cells and neuronal progenitors, pancreatic cells, prostate-crest stem cells and neuronal progenitors, pancreatic cells, prostate-crest stem cells and obtaining close defects, fractures, catheroscis, restenosis and obbeity. Stimulation of osteoblasts costeoporosis and other deficiencies in bone structure and formation.

CC sFGF11 is useful for treating disorders associated with diabetes costeoporosis, cerebrovascular stroke, neuropathy associated with lack of menoral cell development or degeneration, amyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of menoral differentiation and congenital disorders of the nervonal differentiation and congenital disorders of the oper circulation such as diabetic food ulcers, improving cardiac concentration, modulating surfactant production in the lumn of cutous spatem or lack and subsective conduction of ischaemia-reperfusion events, particularly in the heart or brain and for inducing skeletal muscle neogenesis and/or hyperplasia, kidney regeneration and/or for

The invention relates to one hundred and twenty two nucleic acids canceding PRO polypeptides. The sequences of the 122 PRO polynucleotides encoding PRO polypeptides. The PRO nucleic acids, polypeptides, and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, epecially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in periorte calls, for stimulating the release of tumour necrosis factor-alpha from human blood, stimulating or inhibiting the proliferation of normal human blood, for stimulating or inhibiting the proliferation of normal human blood, stimulating or inhibiting the proliferation of normal human blood, weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, fibroblast growth factor; FGF, zFGF11; mesenchymal cell; FGFRIIIc; osteoblastic lineage cell; diabetes mellitus; neuropathy; neural cell development, amyorrophic lateral sclerosis; cerebrovascular stroke; neuronal differentiation; congenital disorder; nervous system disorder; cardiac function; wound healing.

The present invention relates to new extracellular messenger polypeptides and polymucleotides encoding them. XMES is useful in the diagnosis, cand polymucleotides encoding them. XMES is useful in the diagnosis, treatment and prevention of neurological disorders (e.g. epilepsy, cartone, or Alzheimer's disease), autoimumue/inflammatory disorders (e.g. acquired immune deficiency syndrom. AIDS, Addison's disease, or allergies), developmental disorders (e.g. renal tubular acidosis, anaemia or Cushing's syndrome), endocrine disorders (e.g. hypophysectomy, cor cushing's syndrome), and call proliferative disorders (e.g. cancer), and in the assessment of the effects of exogenous or compounds on the expression of nucleic acid and amino acid sequences of compounds on the expression of nucleic acid and amino acid sequences of critacil, bacterial, fungal, parasitic, processal and helminthic infections, trauma, disorders associated with hypopituitarism, cor hypothyroidism, hyperthyroidism or gonadal steroid hormones, and companies may be used for somatic or germline gene therapy. The present sequence is human XMES-3 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, PRO polypeptide; secreted and transmembrane protein; anti-PRO antibody; diagnostic assay; gene expression; tumour; cytostatic.
                                                                                  New extracellular messenger polypeptides and polynucleotides encoding them, useful for diagnosing, treating or preventing e.g. neurological, autoimmune, inflammatory, developmental and endocrine disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 86; DB 5; Length 208; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                    The invention relates to an isolated human polypeptide (1) for zFGF11 (a fibroblast growth factor), and the encoding polynucleotide (II). (1) and methods of the invention stimulating proliferation of mesenchymal cells, detecting the presence of zFGF11 in a biological sample, detecting the presence of zFGF11 in a biological sample, detecting the presence of zFGF11 in a biological sample, detecting the presence of zFGF11 in a biological sample, comparing proliferation of osteoblastic lineage cells. The polypeptides, nucleic acid and/or antibodies of the invention may be used polypeptides, nucleic associated with diabetes mellitus, neural cell development or degeneration, amyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of cerebrovascular stroke, neuropathy associated with lack of maintenance of cerebrovascular development. Molecules of the invention may also be used useful for improving cardiac function and for promoting wound healing of the present sequence represents the amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; extracellular messenger; neurological disorder; epilepsy; XMES-3; Alzheimer's disease; autoimmune disorder; renal tubular acidosis; stroke; acquired immune deficiency syndrome; ALDS; Addison's disease; cytostatic; developmental disorder; anaemia; Cushing's syndrome; endocrine disorder; vascular malformation; cell proliferative disorder; gene therapy; cancer; neuroprotective; trauma; hypopiunitarism; hypothyroidism; antihelminthic; hyperthyroidism; gonadal steroid hormone; pancreatic disorder; nootropic; diabetes mellitus; immunosuppressive; anti-inflammatory; antibacterial; antiviral; antifungal; parasitic; protozoal; allergy.

WPI; 2003-342045/32. N-PSDB; ACA66879.

The invention describes an isolated mucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide comprised sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, blosensors or plynucleotides are useful cumour, breast tumour, prostate tumours (e.g. lung tumour, or liver tumour) in a mammal, for stimulating the release of TNF-alpha from human blood, or commal human dermal fibroblast proliferation. The PRO nucleic acid or polypeptide is also useful for treating tumours or various bone and/or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for thearpeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases, and in the diagnostic calso useful in drug screening, particularly as targets for thearpeutic intervention in these diseases. The PRO polypeptides are useful or the presence of these diseases, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the presence of these diseases. The PRO polypeptides are useful or the armony of the presence of these diseases. The PRO polypeptides are useful or the armony or the processing and the processing or the armony or the process

```
The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnostis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS073-ABUS0860 represent the human PRO polypebtides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; secreted and transmembrane protein; PRO; cytostatic; antiarthritic; osteopathic; gene therapy; TNF-Agonist-Alpha; chondrocyte stimulator; fibrobiast modulator; paramaceutical; diagnostic; biosensor; bioreactor; tumour; lung tumour; oolon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; bone disorder; cartilage disorder; sports injury;
One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating

Treating a mammal exhibiting Type 2 diabetes or Type 1 diabetes or obesity, by administering composition comprising fibroblast growth factor
                                                                                                                                                                                        nuclearized uncertained out transmembrane (PRO) polypeptides. The proceding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; fibroblast growth factor 21; FGF-21; chromosome 19; 19q13.1-qter; diabetes; obesity; antidiabetic; anorectic; type 2 diabetes; type 1 diabetes.
                                                                            One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal.
                                                                                                                                                                                 The invention describes one hundred and eighty seven nucleic acids

The present sequence represents human fibroblast growth factor 21 (FGF-21). FGF-21 is located to chromosome 19, more specifically to 19q13.1-creating a meanmal exhibiting type 2 diabetes or type 1 diabetes, or treating a meanmal exhibiting type 2 diabetes or type 1 diabetes, or treating a mammal composition chesity which comprises administering to the mammal a composition comprising FGF-21 which has at least 95% amino acid sequence identity to the 20% amino acid sequence given in ABP96156. Also described: (1) inducing an increase in glucose uptake in adjocyte cells by administering FGF-21 to induce an increase in glucose uptake, and (2) administering FGF-21 to induce an increase in glucose uptake; or comprised to a mammal using FGF-21 having 95% amino acid sequence or or obesity in a mammal using FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 has antidiabetic and anoractic activities. The method is useful for treating a mammal for obesity. The method is preferably useful for treating type 1 or type 2 diabetes, and for treating domestic animals for obesity. The method is preferably the animals for obesity. The method is preferably the animals for obesity in type 2 diabetes, and for treating domestic animals for obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in perfecte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding for a PRO protein, useful for the manufacture of a medicament for diagnosing or treating tumors or for measuring or detecting expression of an associated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gerritsen ME, Goddard A, Godowski PJ;

New PRO protein encoding nucleic acid, useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumor in a mammal

Claim 11; Fig 78; 324pp; English

The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthernore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention RESULT 14
